- 100% All-Natural with no chemical additives, no preservatives and no artificial flavors
- Clinically proven and veterinarian recommended
- Made in the U.S.A. with premium American Beefhide
- Natural bacon flavor that dogs love

The Importance of Dental Care

DentaGuard Chews were developed to help combat the most common health problem diagnosed in dogs - Periodontal Disease, which affects nearly 80% of dogs over the age of three. It is caused by oral bacteria in dental plaque that hardens into tartar if it is not removed by toothbrushing or by a veterinarian during a professional dental cleaning. The plaque and bacteria accumulations can lead to many health problems as well as gingivitis, bleeding gums, tooth loss and malodor.

Clinically Proven

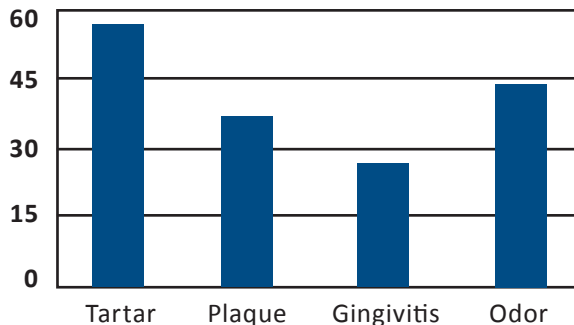

Clinically proven DentaGuard Chews are prepared in a proprietary manner that results in its fibrous nature. These rawhide fibers act like dental floss and allow it to remove dental plaque during chewing, and this has been shown to improve dental health as well as oral malodor. Made from minced and extruded American beefhide, they are much safer than traditional rawhide and are easy to chew and digest.

Clinical Trial Results

Clinical trials conducted at the Indiana University School of Dentistry and in a veterinary hospital have proven the ability of DentaGuard Chews to prevent plaque, tartar and gingivitis.

Maximum Percent Reduction of Dental Disease Symptoms

The results of five controlled clinical trials show that the daily use of DentaGuard Chews prevents tartar by as much as 50%, while also reducing plaque, gingivitis and malodor.
